Local Run Setup

Conda

Conda is an open source, cross-platform, language-agnostic package manager and environment management system that installs, runs, and updates packages and their dependencies. It was created for Python programs, but it can package and distribute software for any language (e.g., R), including multi-language projects. The Conda package and environment manager is included in all versions of **Anaconda**, **Miniconda**, and Anaconda Repository.

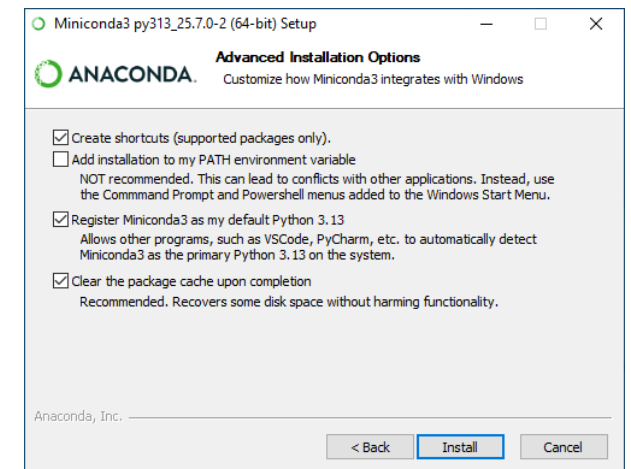

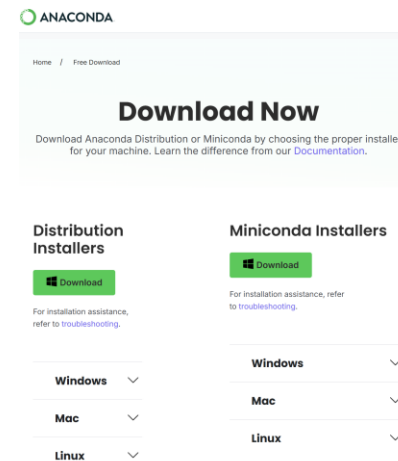

- Simplifies installing, updating, and removing packages and dependencies.
- Let us create isolated environments with different package versions.

Download

- <https://www.anaconda.com/download/success>
- <https://docs.conda.io/en/latest/>

Documentation

- <https://docs.conda.io/projects/conda/en/stable/user-guide/getting-started.html>
- <https://docs.conda.io/projects/conda/en/stable/user-guide/cheatsheet.html>

Conda: Create a Python Environment

Open Anaconda prompt (in windows should be in the apps)

Create env. with name cvc and last python version

- `conda create --name cvc python`

Activate env.

- `conda activate cvc`

Install Python Requirements

Pytorch(CPU or GPU) (<https://pytorch.org/get-started/locally/>)

- **CPU (only):** pip install torch torchvision
- **GPU:** pip install torch torchvision --index-url <https://download.pytorch.org/whl/cu126>

Other dependencies

pip install numpy transformers matplotlib opencv-python opencv-contrib-python
ipywidgets scikit-learn

```
Select Anaconda Prompt - conda create --name cvc python

(base) C:\Users\hsilva>conda create --name cvc python

Visual Studio Code IDE (VSCode)

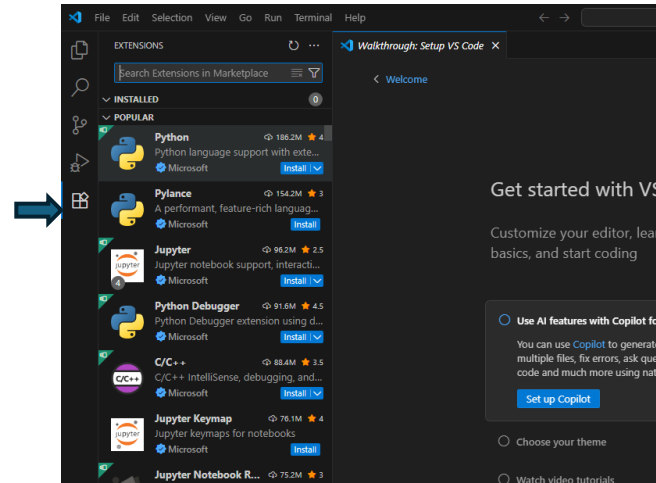

Download:

<https://code.visualstudio.com/download>

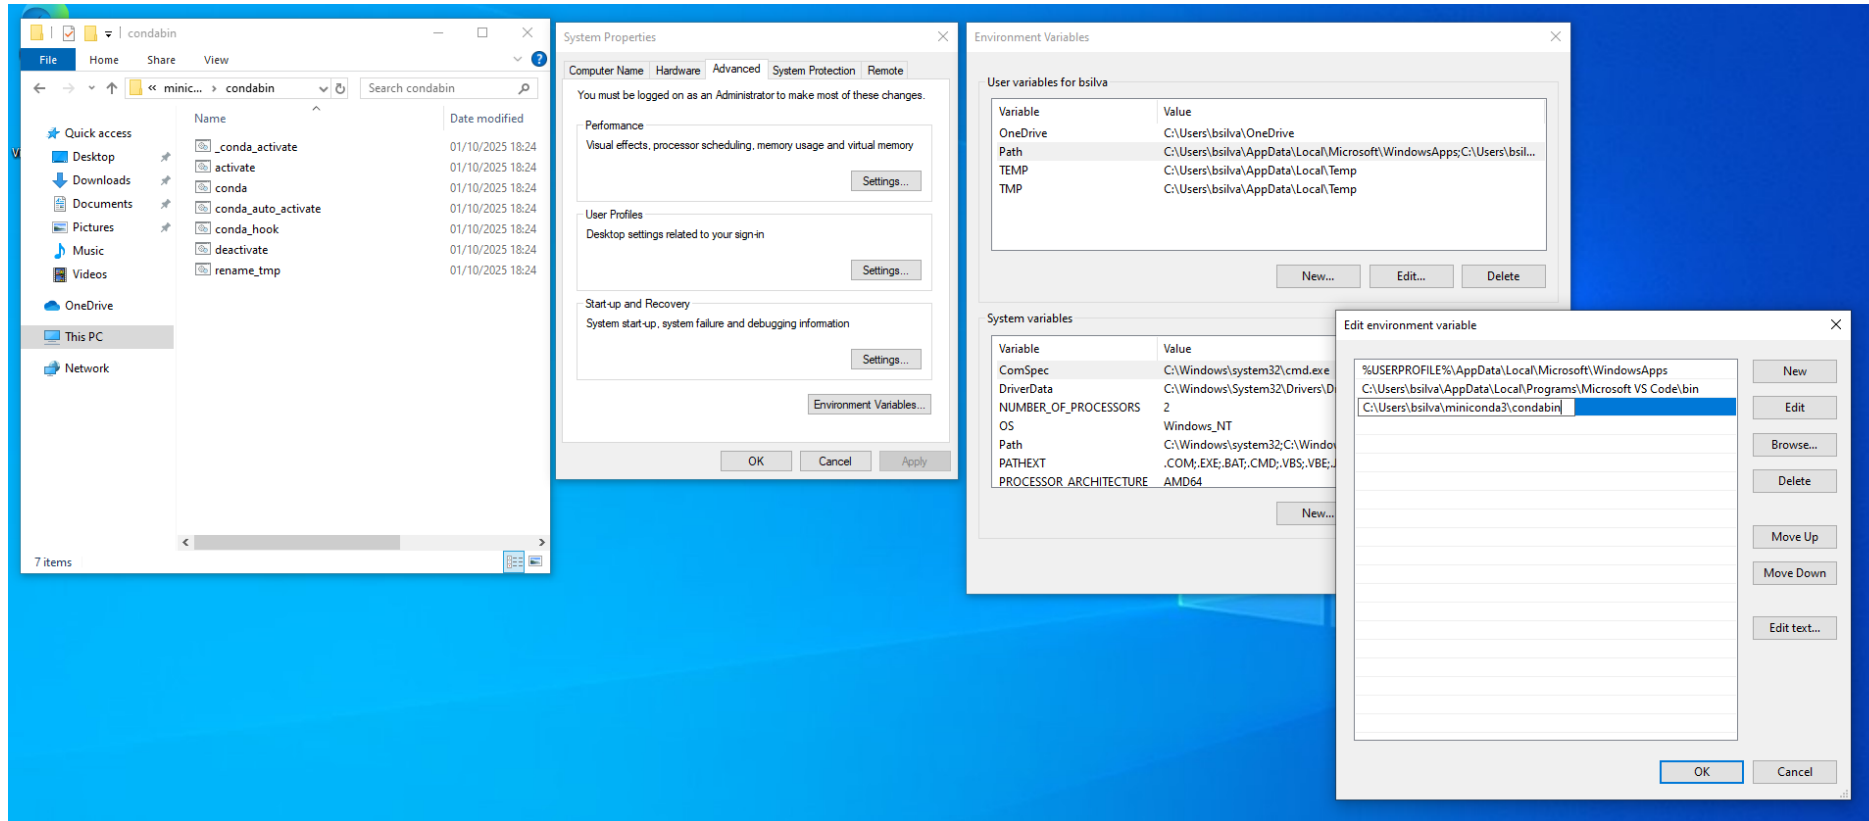

Install Python Extensions

- Python
- Jupyter

VSCode ➔ Anaconda

In case your python environment is not found in Visual Studio Code:

- Find your anaconda path, by default is in (C:\Users\<username>\miniconda3\condabin)
- System properties ➔ Environment Variables ... ➔ Edit the Path ➔ New (add the new path) ➔ Ok
